When it's not facing World Champion Garry Kasparov's withering glare, Deep Blue's RS/6000® technology is being put to work on plenty of practical applications. The same processing power that lets Deep Blue sort through millions of chess moves a second can be used to sort through millions of book titles at thousands of libraries, anywhere in the world. It can also cross-reference topics and suggest books you might never have thought of. Colleges across the country are using this technology to give their students better access to the information they need. So, as IBM researchers learn from Deep Blue's chess performance, students everywhere will be learning a few things of their own. To find out more about the match, as well as why we're playing it, stop by [www.chess.ibm.com](http://www.chess.ibm.com)

Solutions for a small planet™
